

# FastSteer™ Steering System

The New Holland FastSteer™ Steering System allows tractor operators to increase the speed of their steering as well as minimize the amount of effort required to execute that action. Using a control ring integrated into the steering wheel, the operator is able to divert maximum available pump flow directly to the steering cylinders with only an 8° movement of the steering wheel in the desired steering direction. Operators can reduce their fatigue levels by using this simple system to lower the amount of effort required to execute their steering action. In addition, operators can save time by taking advantage of the faster steering response. FastSteer™ allows operators to go from lock to lock (as far as the wheels will go from one side to as far as they will go to the other side) as fast as the vehicle is capable, so they can turn tighter and faster in space-limited areas.
